The LifeWatch show cases will facilitate the development of integrative researches on key scientific issues by using already existing evidences, which will be organized and reinforced with additional LifeWatch information and made accessible to the scientific community and the general public.

The case studies thus far identified (and now in the starting phase) are:

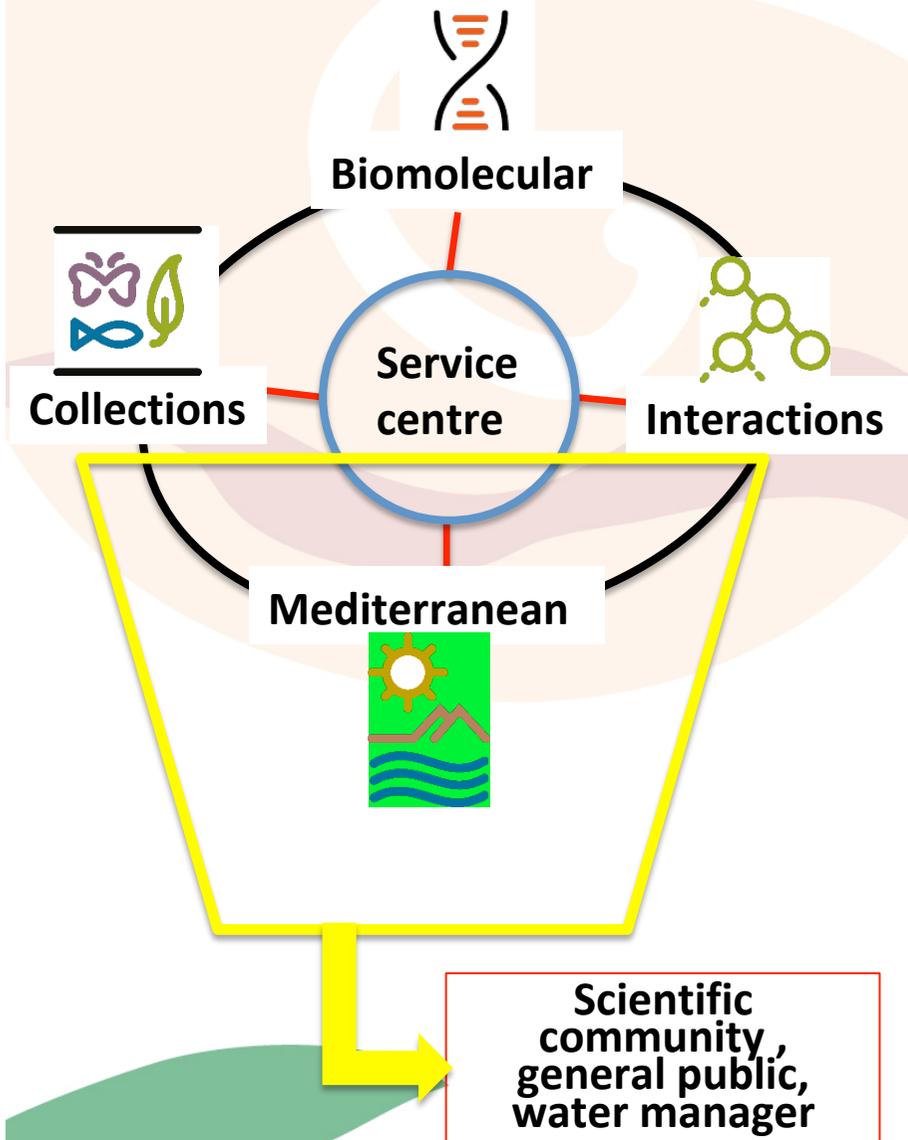

- Monitoring Alien Species (coordinated by Italy),
- Migrating Birds (coordinated by Netherlands) and
- Wetlands (coordinated by Spain).

### LIFEWATCH opportunities:

- To capitalise on existing knowledge;
- To integrate inter-disciplinary fields, data sources and processing tools

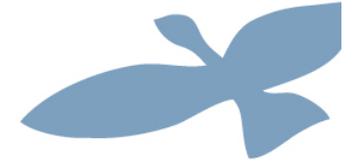

### for improving:

- our way to address innovative scientific questions;
- our current understanding of biodiversity;
- the certainty of environmental management, governance and policy

**sharing software facilities**

# Show cases proposed

- *Wetlands* - SP (to study biodiversity in marine wetlands)
- *Migratory birds* - NL (to study their navigation and foraging strategies on land and at sea)
- *Alien species* - IT (to study the vulnerability of fresh-, marine and brackish waters and terrestrial habitats to AS invasion. The results will allow the mapping of the vulnerability of different ecosystem types)

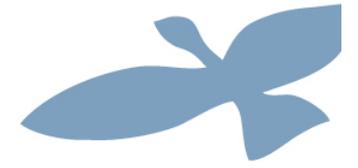

**These case studies were developed to demonstrate the functionality of the e-infrastructure and its potential**

## Alien Species Thesaurus

### Alien Species

Home ▶ Alien Species

**Definition:**

A species, subspecies or lower taxon, introduced outside its natural past or present distribution; includes any part, gametes, seeds, eggs, or propagules of such species that might survive and subsequently reproduce (CBD, 2002).

**Historic note:**

A species, subspecies, or lower taxon occurring outside of its natural range (past or present) and dispersal potential (i.e. outside the range it occupies naturally or could not occupy without direct or indirect introduction or care by humans) and includes any part, gametes or propagule of such species that might survive and subsequently reproduce (ISSG, 2000).

**Historic note:**

A species occurring in an area outside of its historically known natural range as a result of intentional or accidental dispersal by human activities (also known as an exotic or introduced species) (UNEP-WCMC, 2014)

# Alien Species definition

## FW

- **1492**: any species deliberately or inadvertently introduced to Italy by human activities after the discovery of the New World by Columbus in 1492, similar to what plant invasion biologists call 'neophytes' (Pyšek, 1998)

## MW & TW

- **1869**: all marine and lagoon species introduced into Italian waters since the opening of the Suez Canal (Zenetos et al., 2010)

**The term alien is used in its broadest meaning,  
without considering the naturalization stage of species**

linear Mixed Effect Model

	no. species			% species		
	estimate	SE	p-values	estimate	SE	p-values
(intercept)	-6.63	1.19	<0.0001	-6.358	0.77	<0.0001
habitat	-0.086	0.398	0.8289	-0.603	0.376	0.1091
richness	0.777	0.204	<b>0.0001</b>	0.148	0.177	0.4012
precipitation	-0.013	0.138	0.9196	0.149	0.124	0.2277
temperature	1.455	0.302	<b>&lt;0.0001</b>	1.112	0.266	<b>&lt;0.0001</b>

**AS no. positively correlated with species richness, accessibility and air temperature**

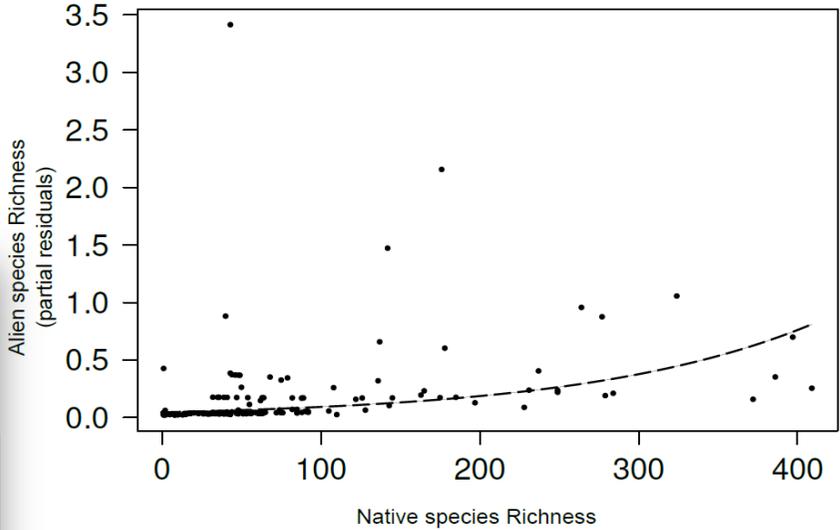

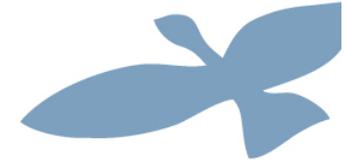

# Marine waters case study

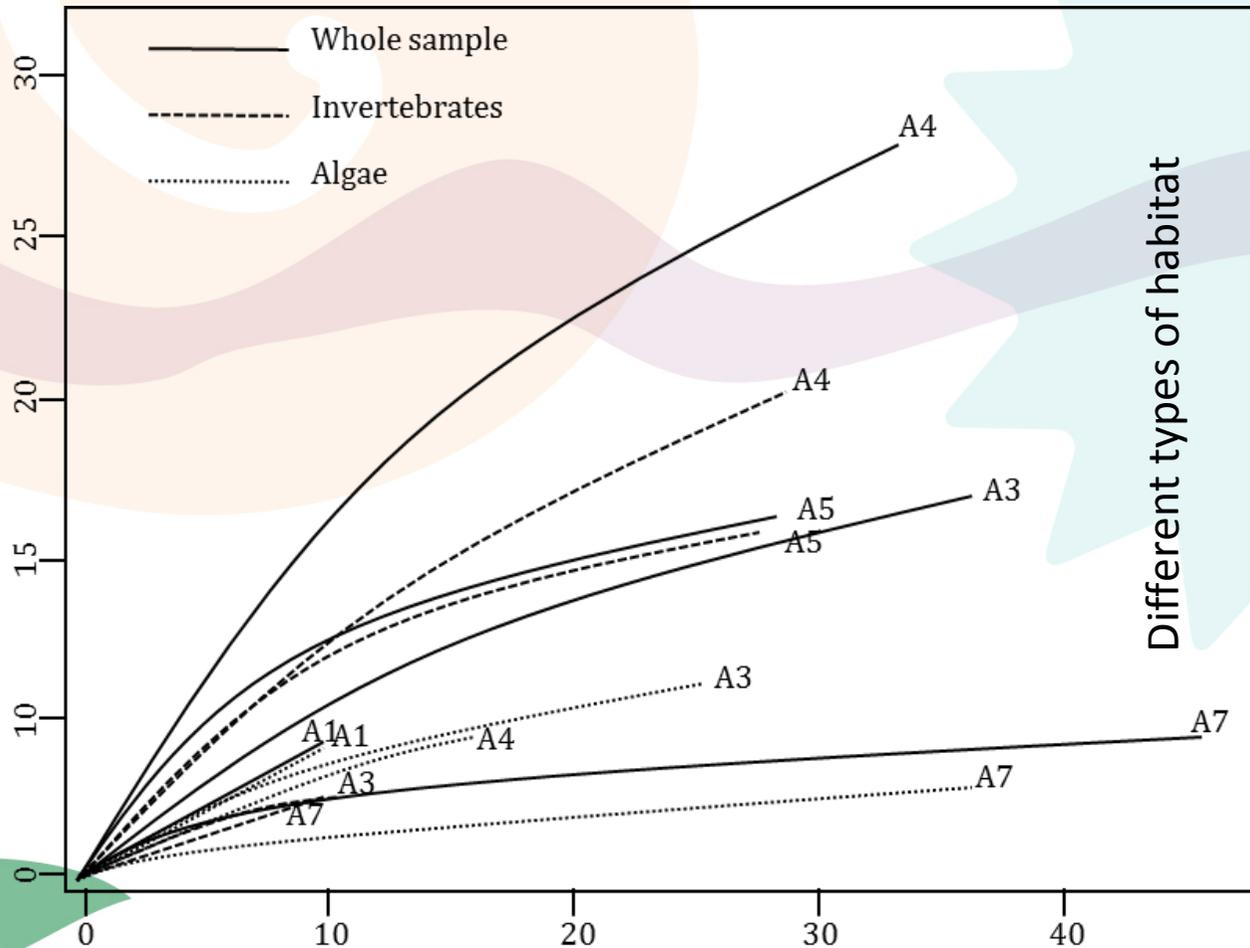

**Positive correlation with species richness**

**Positive correlation with species richness and accessibility**

**No habitat reached a plateau indicating that could host an even larger AS number**

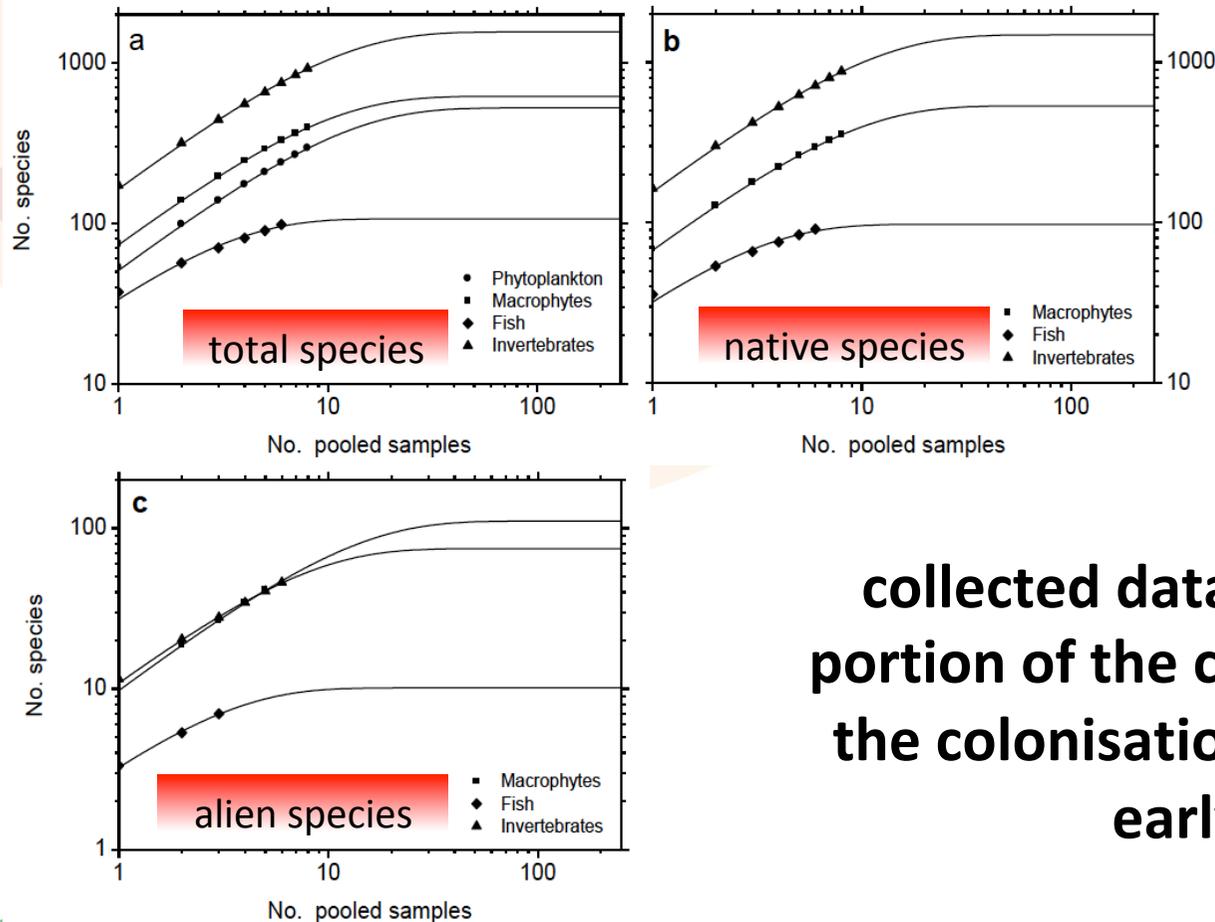

Different types of habitat

# Transitional waters case study

Transitional waters represent ecotone ecosystems, naturally exposed to immigration from their freshwater and marine input environments

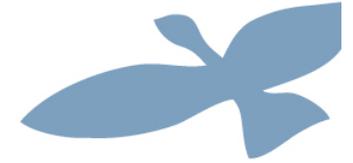

collected data on the growing portion of the curves suggest that the colonisation process is at an early stage

## Number of alien species

	estimate	se	p
(intercept)	-3.252	0.714	<0.001
Openness	-0.500	0.145	<0.001
Richness (N Taxa)	-0.0004	0.0005	0.437
Salinity	0.005	0.016	0.769
Surface	0.006	0.002	<0.01
Habitat	-0.198	0.328	0.546
Vettori	0.028	0.053	0.592

linear Mixed Effect Model

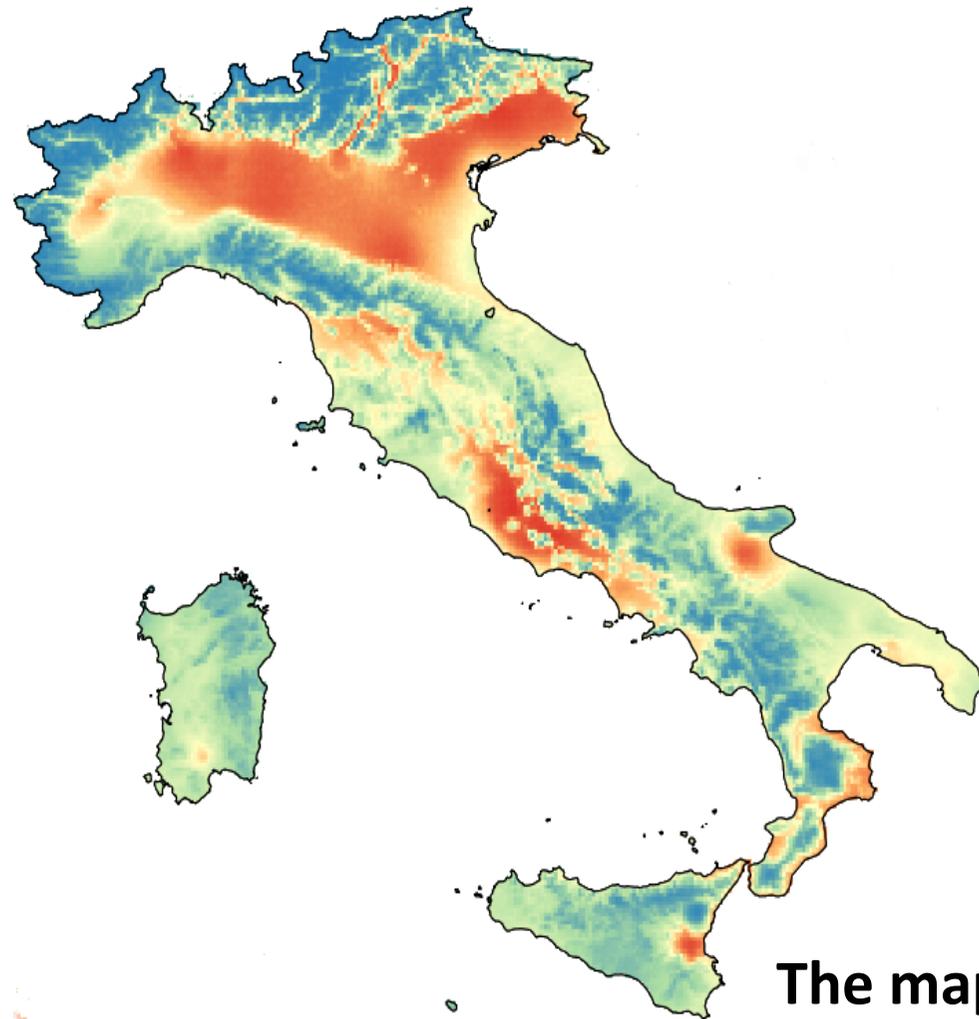

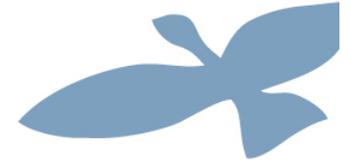

**Openness and lagoon surface area show a positive effect on AS presence**

- It is difficult to define the vulnerability of a habitat in relation to AS, being the vulnerability an intrinsic characteristic of the ecosystem related to stability, temporal variability, local climatic conditions, evenness, species succession, resistance etc.
- LifeWatch will contribute achieving a better understanding and managing of biological invasions in different habitats (from terrestrial to aquatic) along different perspectives, from macroecology to genomics.
- LifeWatch, through its network, favours the cooperation among researchers from diverse backgrounds, the sharing and the availability of data, and the request for information.
- LifeWatch leaves a professional asset to be used from persons concerned

# Risk maps

Based on a model explaining AS occurrence through:

- Air temperature
- Precipitation amount
- site accessibility

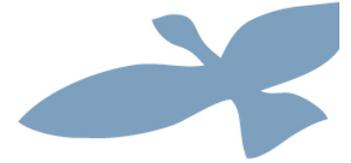

**Resolution ~ 5 km**

**The map highlights areas at high/low risk of invasibility**

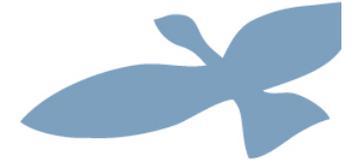

## Implementation of tools

**All analyses performed using dedicated R packages are one of the services provided by LifeWatch on the web**

***Alien species ecological impacts: from genomics to macroecology***

Chair: Angela Boggero, CNR-ISE, Verbania

Chair: Monica Santamaria, CNR-IBBE, Bari

Chair: Alberto Basset, Università Salento, Lecce

Three main issues will be addressed, from single species, to individual populations and whole ecosystems: i) the state of the art of biological invasion in freshwaters, ii) the comparison across typologies (from inland to coastal marine aquatic ecosystems), iii) the eScience approach to alien species impacts
